

STANDALONE FINGERTEC TERMINALS

Distributed IP Access Control Topology

Benefits

- **Size**
For small/medium scale implementations
- **Reduced cost per door**
There is no need for a control panel. Thus, the average cost of one-door installations is minimal when the number of doors serviced is lower.
- **Scalability**
Install hardware only at specific access points where necessary, to ensure that there is no inefficient wastage of capacity.
- **Lower installation cost**
By not requiring elaborate wiring methods for one-door installations, installation costs and time spent are kept low.
- **Stability**
One of the benefits of a fragmented system is that the failure of one part of the system will less likely affect the rest, theoretically eliminating downtime.
- **Leverage**
Being able to utilize existing network infrastructure means less time & resources spent on creating a new one.
- **Proximity**
Monitoring is physically close for management as it is better suited for SMEs that cover comparatively small land areas and less than 50 doors.
